

# GENETIC ALGORITHMS: THE BINARY GA

Date: Friday 1 April 2016

Course: Functional Programming and Intelligent Algorithms

Lecturer: Robin T. Bye

# Components of binary GA

# Algorithm flow

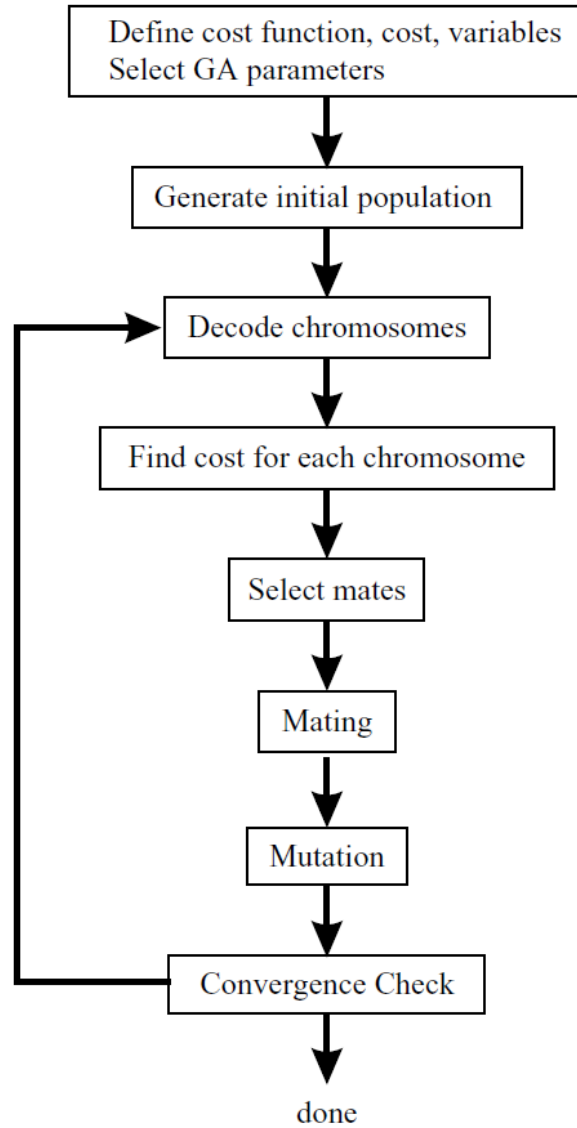

1. Define cost function, cost, variables.  
Select GA parameters.
2. Generate initial population.
3. Decode chromosomes.
4. Find cost for each chromosome.
5. Select mates for reproduction.
6. Mating.

# Algorithm flow

7. Mutation.

8. Check stopping criteria

- IF (reached max number of iterations OR converged) THEN stop
- ELSE go to Step 3.

**Figure 2.2** Flowchart of a binary GA.

Adapted from [1].  
5

# Variables and cost function

- Nvar-dimensional problem  $\rightarrow$  chromosome has Nvar variables (genes),  $i=1, \dots, Nvar$
- $chrom = [p1, p2, \dots, pNvar]$
- $Cost = f(chrom) = f(p1, p2, \dots, pNvar)$
- Example: 2D height map in xy-plane
  - $chrom = [x, y]$
  - $cost = height = f(chrom) = f(x, y)$

# Variables and cost function

- If too many variables  $\rightarrow$  slow GA
- Eg.  $f = 2x + 3y + z/10000 + \sqrt{w}/9876$  with constraints  $1 \leq x, y, z, w \leq 10$
- Due to constraints,  $z, w$  terms relatively small  $\rightarrow$  ignore:  $f = 2x + 3y$
- Variable interaction (epistasis)
  - GA good for medium/high interaction
  - Random search good for high interaction
  - Minimum-seeking good for low interaction

# Encoding/decoding

- Encoding: Convert variable values to binary genes
- Decoding: Convert binary genes back to human-readable variable values
- Example:

Bin	Dec	Numbers	Alt. Numbers	Colour	Speed
00	0	10	13.75	Red	Slow
01	1	20	21.25	Green	Medium
10	2	30	28.75	Blue	Fast
11	3	40	36.25	Yellow	Superfast

# Encoding/decoding

- Example continued:
  - gene1 = 01  $\Leftrightarrow$  medium
  - gene2 = 10  $\Leftrightarrow$  fast
  - gene3 = 11  $\Leftrightarrow$  superfast
  - gene4 = 00  $\Leftrightarrow$  slow
- chrom = [gene1, gene2, gene3, gene4]  
= [01101100] = [med, fast, supfast, slow]

# Encoding/decoding

- Goal: Sort categories in increasing order (slow,medium,fast,superfast)
- Cost: 0 for correct place, 1 for one place off, 2 for two places off, etc.
  - $[01101100] = [\text{medium,fast,superfast,slow}]$ 
    - $\rightarrow \text{Cost} = 1 + 1 + 1 + 3 = 6$
  - $[00100111] = [\text{slow,fast,medium,superfast}]$ 
    - $\rightarrow \text{Cost} = 0 + 1 + 1 + 0 = 2$

# Encoding/decoding

- Number of bits Nbits in chromosome:
  - Ngene = number of bits in each gene/var
  - Nvar = number of genes/variables
  - Nbits = Ngene × Nvar = number of bits

# Population

- Set of  $N_{pop}$  chromosomes
- Each chromosome has  $N_{bits}$
- Represented as matrix of binary digits
- Dimensions are  $N_{pop} \times N_{bits}$
- Initial population randomly assigned:
  - `pop=round(rand( $N_{pop}$ ,  $N_{bits}$ ));`

# Natural selection

1. Rank chromosomes (low cost better)
2. Only keep best fraction (selection rate  $X_{rate}$ ) of  $N_{pop}$  chromosomes  $\rightarrow N_{keep} = X_{rate} \times N_{pop}$  chromosomes survives
3. Let kept chromosomes mate and replace discarded chromosomes

# Pairing methods

- From top to bottom (1+2, 3+4, etc.)
- Uniform random pairing
- Weighted random pairing
  - rank weighting
  - cost weighting
- Tournament selection
- Others

# Mating

- Randomly pick a crossover point
- Parent1 passes left-bits to offspring1 and right-bits to offspring2
- Parent2 passes left-bits to offspring 2 and right-bits to offspring1
- $p1 = [L1 \mid R1]$ ,  $p2 = [L2 \mid R2] \rightarrow$
- $o1 = [L1 \mid R2]$ ,  $o2 = [L2 \mid R1]$
- Other schemes exist

# Elitism

- Always keep best chromosome in population and never mutate it!
- Do not throw away a good solution!

# Next generation

- Insert offspring into population
- Recalculate costs and repeat process until
  - convergence
  - max number of iterations reached
  - you are happy for some reason

# Example 2D problem

# Example 2D problem

Three-dimensional view of the cost surface with a view of Long's Peak.

# Example 2D problem

## Encoding

**TABLE 2.2 Binary Representations**

Variable	Binary	Decimal	Value
Latitude	0000000	1	40°15'
Latitude	1111111	128	40°16'
Longitude	0000000	1	105°36'
Longitude	1111111	128	105°37'30"

$$\text{chromosome} = \left[ \underbrace{1100011001}_{x} \underbrace{1001}_{y} \right]$$

# Example 2D problem

Initial population

**TABLE 2.3 Example Initial Population of 8 Random Chromosomes and Their Corresponding Cost**

Chromosome	Cost
*00101111000110	-12359
11100101100100	-11872
*00110010001100	-13477
*00101111001000	-12363
11001111111011	-11631
01000101111011	-12097
*11101100000001	-12588
01001101110011	-11860

\* best chromosomes
